

SOFTWARE RELEASE OVERVIEW

VibroSight® 4.0

VibroSight® 4.0, released in March 2019, adds the following main benefits and features.

Benefits

- **Data export to third-party systems using OPC UA**
- **Easier configuration of systems with VM600 CPUx cards**
- **Software licensing and order option code changes**

Features

Support for OPC UA

VibroSight now includes support for OPC UA (unified architecture) so that a VibroSight Server can more easily export historical data from a VibroSight data repository to third-party systems such as a DCS, PLC or data analysis tools.

Advantages of OPC UA include platform independence, improved security, multiple properties per data item (tag), and easier system configuration and operation.

Support for OPC UA is in addition to the existing support for OPC Classic (OPC DA and OPC HDA).

Support for different versions of VM600 CPUx card

VibroSight adds support for different versions of the VM600 CPUx card, that is, support for CPUR/IOCR card pairs and CPUR2/IOCR2 card pairs, as follows:

- CPUR is used to refer to the earlier version of the CPUx card with support for card pair redundancy (PNR 600-007-000-VW).
- CPUR2 is used to refer to the latest version of the CPUx card with support for PROFIBUS (PNR 600-026-000-VW).

Features (continued)

Software licencing and order option code changes

Starting with VibroSight 4.0, a software license includes free software updates and upgrades for the duration of the time period defined by the purchased "Updates and support" (default value: 1 year).

As before, there is no expiration date for a license and the VibroSight software can be used indefinitely.

Note: As a result of this Vibrosight software licensing change, a new software license is required in order to run VibroSight 4.0.

Further information

For more detailed information concerning these features and improvements, request the *VibroSight® software version 4.0 release notes* and the latest *Getting started with VibroSight® installation guide*.
